

Minimally Invasive SI Joint Fusion with the iFuse INTRA V™ Allograft Implant System

The **iFuse INTRA V™** Allograft Implant is a triangular bone allograft used to treat SI joint dysfunction.

The minimally invasive **iFuse INTRA V** procedure is performed entirely through a small 2 cm incision in the lower back. Using a soft tissue protector, the small triangular allograft is implanted into the SI joint to provide stabilization and promote fusion.

Since 2009, **SI-BONE** has been a trailblazer in the treatment of SI joint dysfunction, offering products with supporting clinical evidence for the effective management of this condition. We have developed a range of cutting-edge solutions that have evolved over the years to cater to the individual needs of patients and providers.

Please consult your doctor to discuss the benefits and risks of the **iFuse INTRA V** Allograft Implant System.

iFuse INTRA V™ Allograft Implant System

- Minimally invasive procedure.
- Provides immediate joint stabilization.
- Designed to promote fusion.
